**Water is the primordial
matter of all being!**

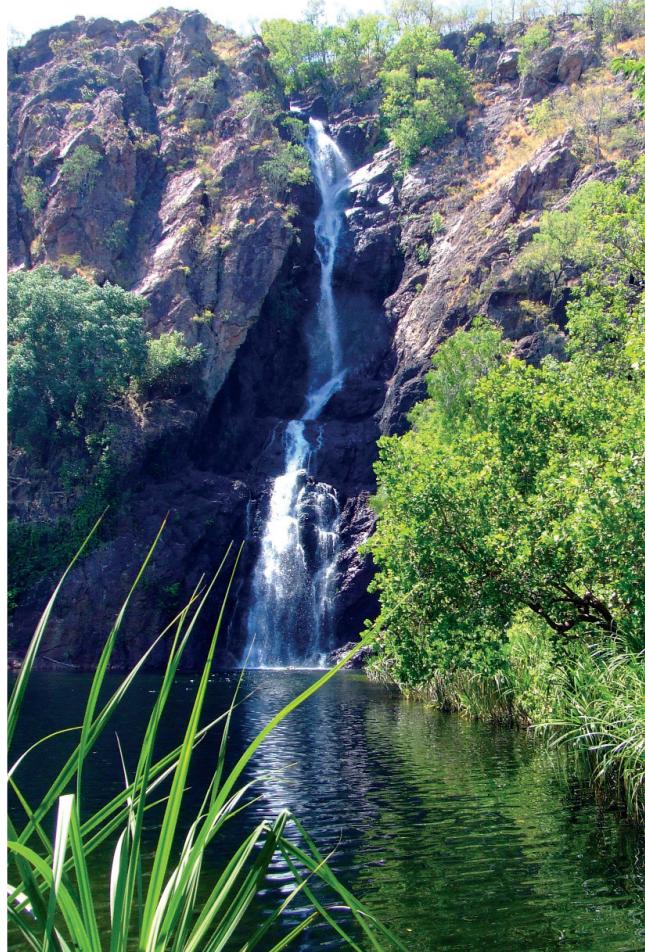

(Thales von Milet)

Layered tanks

Modern energy management

Every heating system has to be designed for the coldest times of the year. However, boilers very rarely have to work to full capacity. For most of the heating period, the average heat consumed is less than 50% of the rated heat output. A storage tank ensures an economic and environmentally-friendly use of energy in spite of this. This "heat manager" holds surplus heat and releases it again to the heat distribution system when required without having to restart the boiler. A Froling layered tank thus helps you reduce your fuel consumption, increases your ease of use and makes a valuable contribution to climate protection.

Flexible applications

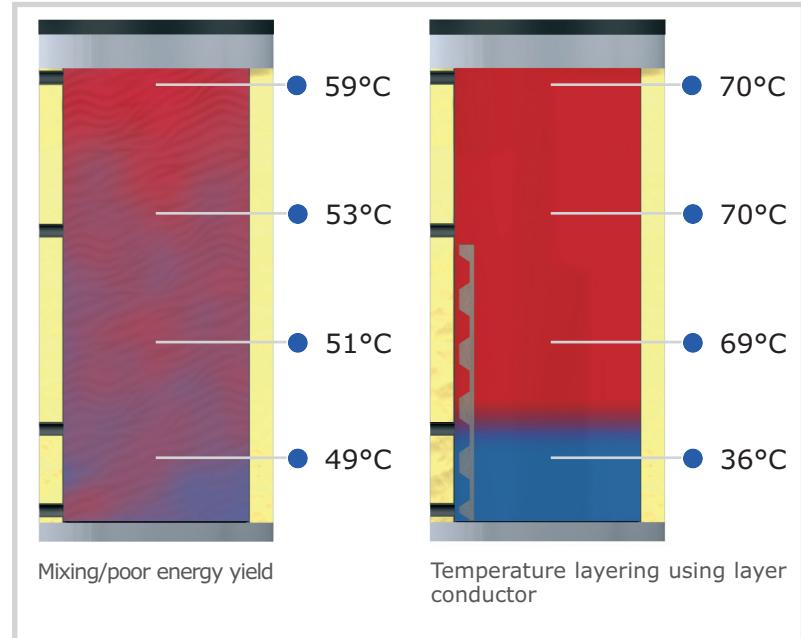

Froling layered tanks are best used in combination with a pellet, waste wood or wood chip boiler, but they can also be used with other heat sources, such as an oil or gas boiler, for example. With the solar layered tank and the H3 hygienic solar layered tank, an efficient solar panel system can also be integrated. The solar power always takes priority thanks to the Froling Lambdatronic's intelligent control management.

Energy management perfected

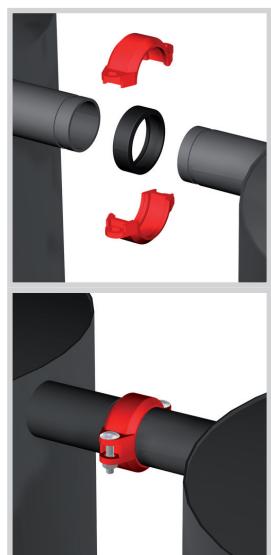

Exact temperature layering in the tank

Precise temperature layering in the tank is crucial for optimal functioning, as it ensures that as much energy as possible can be reused. All Froling layered tanks feature a special layer conductor for this purpose.

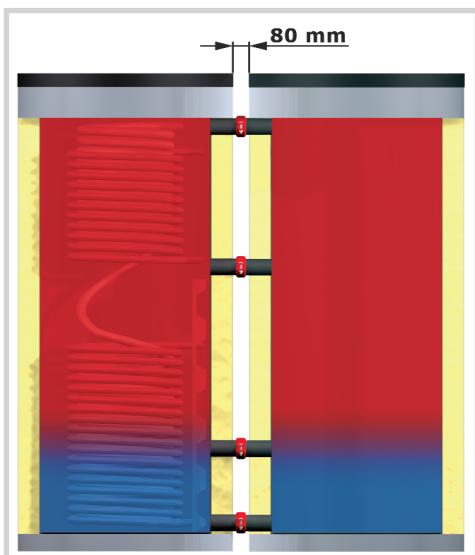

The specially developed layer separator allows inch-perfect temperature layering and guarantees maximum energy yield and low running costs.

Integration made easy

Thanks to their intelligent measurements, Froling layered tanks can be easily installed in the boiler room. And where space is at an absolute premium, Froling offers even more: two short slim tanks can be connected together intercommunicating.

This "package solution with layer guarantee" distributes the heat equally to both tanks. Another advantage is the fast and easy assembly.

Layered tanks

**Systems engineering
perfected**

The original Lambdatronic control for Froeling firewood, waste wood and pellet boilers offers a range of interesting ways to increase efficiency.

The Lambdatronic represents modern energy management. Everything - from the boiler to the entire tank system and the heating to the solar panel system - is operated using just one control.

Now that's surely unique!

Layered tanks / solar layered tanks

The Froling layered tank and solar layered tank

The sophistication is in the detail! Froling's layered tanks and solar layered tanks feature an impressive heat management concept which offers optimal energy intake and extraction in particular.

Froling's solar layered tank also allows you to easily integrate solar power.

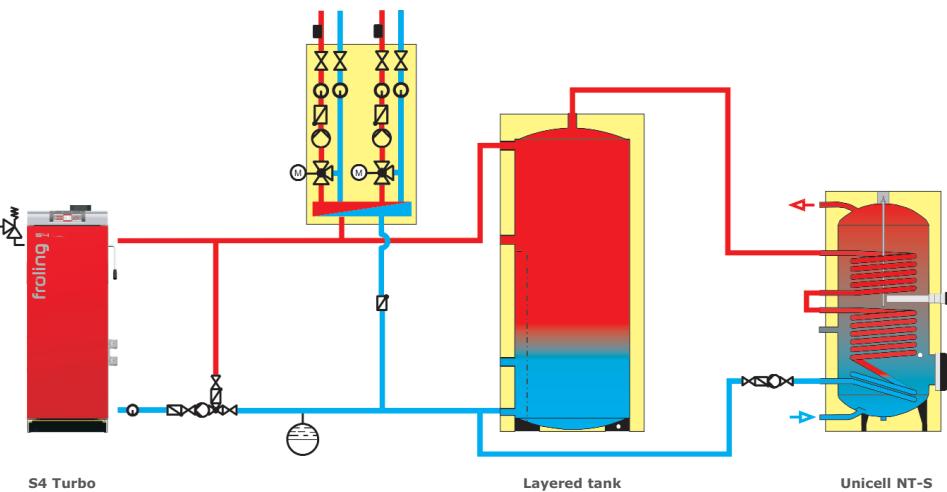

Layered tank / solar layered tank	500	850	1000	1500	1800	2200
Capacity [l]	530	830	1000	1400	1800	2200

H2 Hygienic Layered Tank

The H2 hygienic layered tank

The H2 hygienic layered tank is a quality Froling product which generates hygienically hot water using the flow principle. It is a hot water tank and layered tank in one.

Maximum hygiene thanks to legionella-free domestic hot water

The volume of the storage tank is large, yet the capacity of the high performance stainless steel corrugated pipe element is relatively low. Thanks to the highly efficient heat exchanger surface the tank consistently provides sufficient fresh hot water of exceptional quality using the flow principle. Guaranteed to be free from legionella!

Layered tanks

The H2 hygienic layered tank close up

- 1 **Corrugated stainless steel pipe element** for hygienic water heating. Permanently fresh hot water free from legionella is guaranteed thanks to the flow principle. The short diameter of the corrugated pipe protects against cracks as a result of pressure surges. The corrugated pipe also practically cleans itself. The internal movement means that there is hardly any depositing, even with calciferous water.
- 2 **Reliable layer conductor system** for exact temperature layering in the tank - guaranteeing you an ideal energy yield.
- 3 **High quality insulation** with outer jacket for optimal thermal insulation.

	Connections (outer thread)	[inches]	5/4	5/4

The H3 hygienic solar layered tank

The H3 hygienic solar layered tank

The Froling H3 hygienic solar layered tank is a hot water tank, layered tank and solar layered tank all in one. Two high performance solar elements guarantee efficient solar integration.

The big plus

When used in conjunction with the H3, the solar panel system not only heats water, it can also be used to boost your heating system, especially for preheating domestic hot water in the bottom of your tank. Which means you can maximise your use of solar power.

Layered tanks_

The H3 hygienic solar layered tank close up

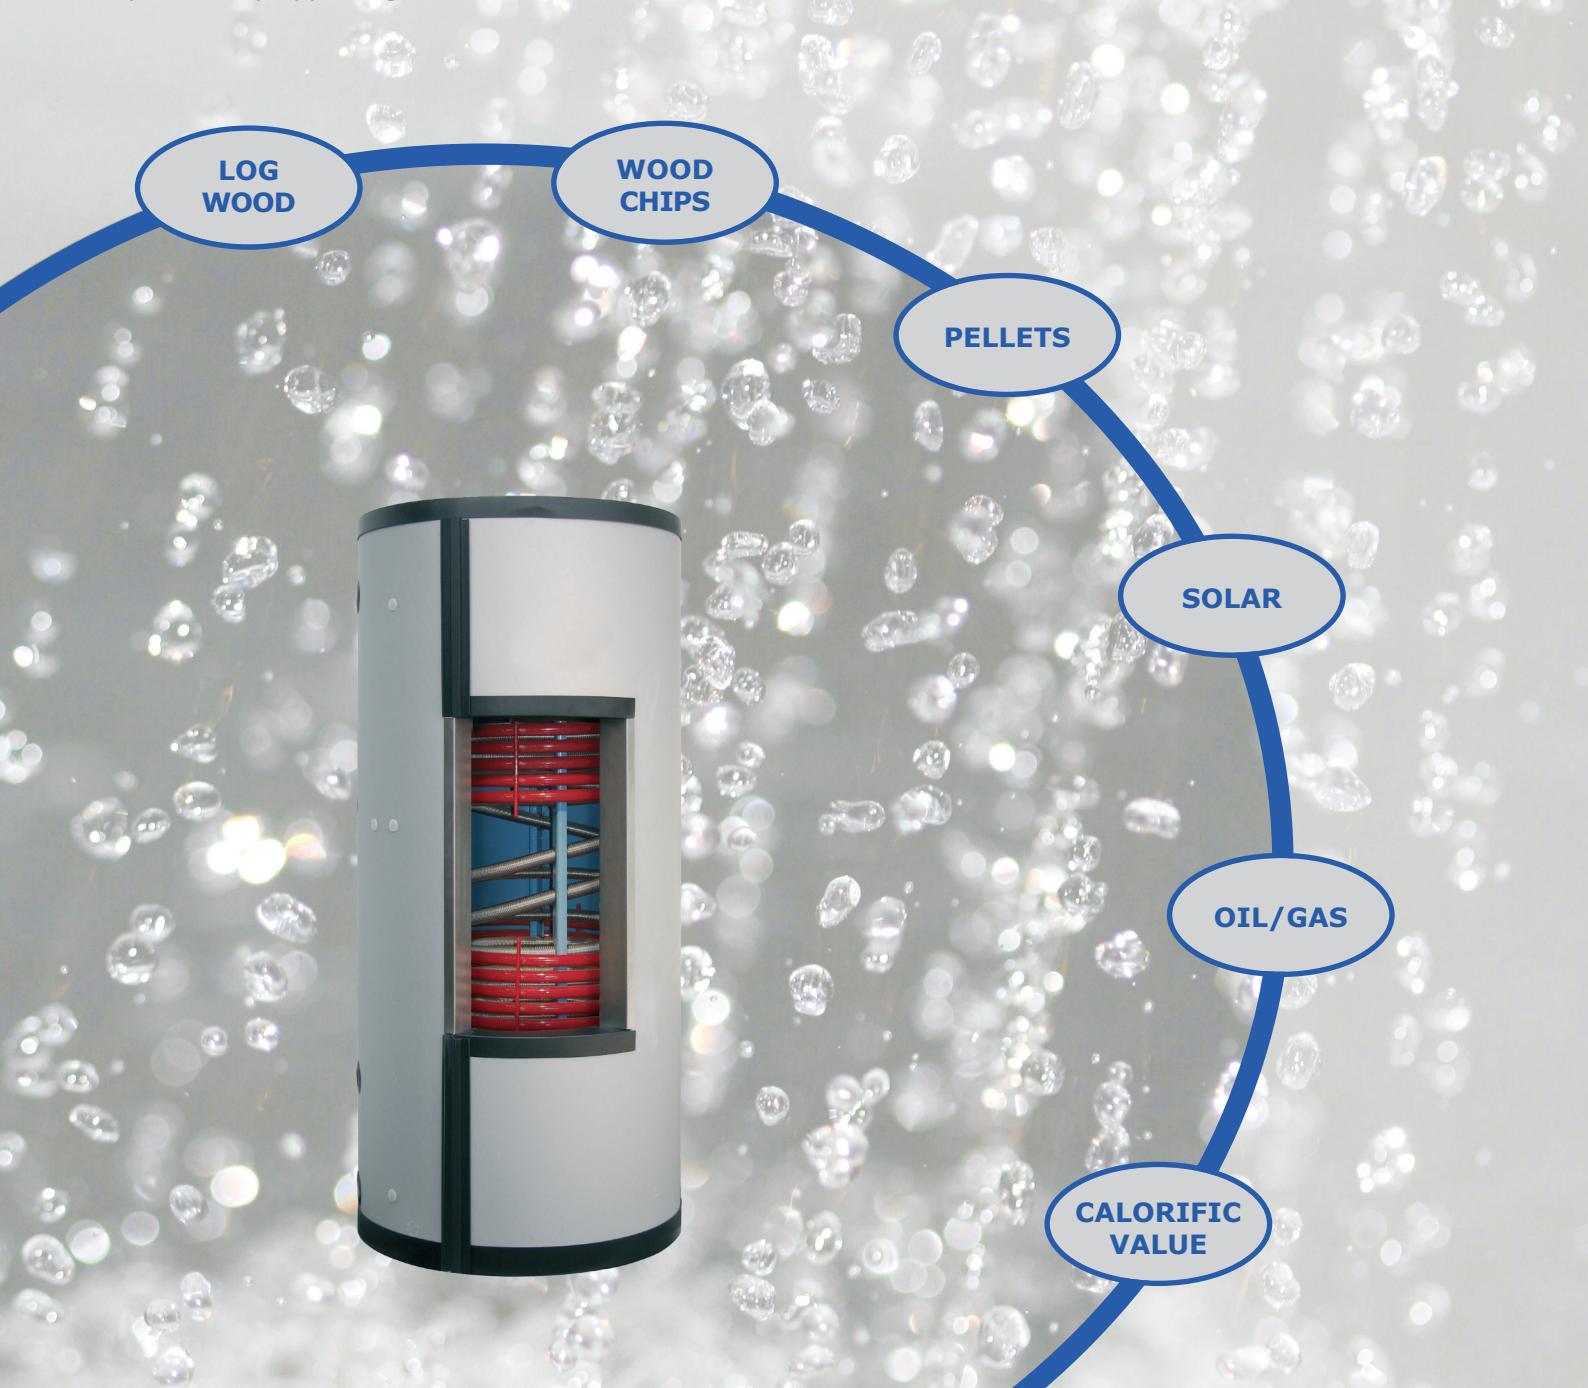

- 1 High performance solar element at the top** to quickly heat the hot water area of the tank. Priority operation to ensure a sufficient hot water supply via the solar panel system as quickly and for as long as possible.
- 2 Corrugated stainless steel pipe element** for hygienic hot water. Permanently fresh hot water, free from legionella, is guaranteed thanks to the flow principle. The large heating surface at the top ensures a high output, the heating surface at the bottom is responsible for preheating and cooling the tank. This optimises the use of solar power all year round.
- 3 High performance solar element** at the bottom ensures that the tank is loaded to full capacity when the solar panel system provides a lot of energy and preheats the cold zone when there is little solar radiation. Ideal in conjunction with systems featuring wall and underfloor heating!
- 4 Reliable layer conductor system** for exact temperature layering in the tank, thus guaranteeing optimal energy yield.
- 5 High quality insulation** with outer jacket for optimal thermal insulation.

H3 Hygienic Solar Layered Tank

Versatile

Froling's H3 hygienic solar layered tank is perfect in combination with a pellet, waste wood or wood chip boiler as well as oil or gas heating - especially for systems which utilise the calorific value and systems for heat recovery. The corrugated stainless steel hot water pipe element which runs through the tank optimally cools the bottom part of the tank by preheating the domestic hot water. The low temperatures at the bottom of the tank enable a low return feed temperature to the collector and thus extremely efficient utilisation of the solar energy irradiation (up to 70% more energy yield depending on the collector type). During the transitional period in particular, but also on sunny winter days, the solar panel system can be used to boost - and possibly even substitute - the heating boiler. The low return feed temperatures available are particularly appealing, as these enable maximum calorific value utilisation in calorific value boilers.

Efficient layered tank systems

Super efficient heating from wood? Guaranteed with Froling layered tanks!

Whether you're installing a new heating system or would like to modernise your current one: Froling storage systems always provide optimal conditions for economic use of energy. With a range of options available, we can easily tailor a solution to nearly all specific system requirements.

Upgrade later? Any time!

Thanks to a special modular system and modular control technology, upgrades can be added any time. Which means that an investment today does not preclude the possibilities of tomorrow.

Want to find out more? We offer more!

Our detailed "Energy systems" brochure contains a range of other systems with exact functional descriptions.
